

Figure S1. Identification of the efficiency of CAPON-S overexpression in glioma cells. **(A)** Lentivirus infection efficiency was indicated by bright field (BF) and GFP fluorescence in Vector group and CAPON-S group. Approximately 80% of U87 and U251 cells were infected by the lentivirus from Vector group and CAPON-S group. Scale bars: 200 μ m. **(B)** Western blot showed that CAPON-S was abundantly overexpressed in the CAPON-S group as detected by both CAPON and GFP antibodies in U87 and U251 cells.
