Methods

Reverse transcription reactions and conditions

The reverse transcription reactions were performed in a 20 μ l reaction mixture including 0.3 μ g RNA, 2 μ l 5'gDNA Eraser Buffer, 1 μ l gDNA Eraser, 4 μ l Nuclease-Free Water, 4 μ l 5 x Primescript Buffer 2, 1 μ l Enzyme Mix1 and 1 μ l RT Primer Mix. The PCR conditions were 67 °C for 15min, 85 °C for 5s.

RT-PCR reactions and conditions

According to the NCBI Nucleotide database, the human HTRA1 has only 1 transcript variant, the primer sequences were listed as follows: HTRA1, 5-GTCTGGTTATTGTGTCGGAA-3 (forward) and 5-CGTTCTTCAGCTCAACTTGACC-3 (reverse); GAPDH, 5-GCACCGTCAAGGCTGAGAAC-3 (forward) and 5-TGGTGAAGACGCCAGTCCA-3 (reverse). The primers were designed using Primer Bank (<https://pga.mgh.harvard.edu/primerbank/>) or Primer Premier 3 (<http://bioinfo.ut.ee/primer3-0.4.0/>). Real-time PCR (RT-PCR) reactions performed in a 10 μ l reaction mixture including 2 μ l cDNA, 5 μ l HieffTM qPCR SYBR GEEN Master Mix, 2.6 μ l Nuclease-Free water, 0.2 μ l upstream primer and 0.2 μ l downstream primer. The RT-PCR conditions were 95°C for 5 min, 95°C for 10s, 60°C for 20s and 72°C for 20s with forty cycles. Melting curve includes 1 cycle with 95°C for 15s, 60°C for 1min and 95°C for 15s. Three parallel samples were set up with a standard deviation less than 0.5, and the average value was calculated.
