

Figure S1. Representative images of oral cancer cells in 2D culture. Scale bar, 200 μm .

Figure S2. (A) Schematic diagram of the transition from 2D to 3D culture. (B) Representative time-specific images of oral cancer cells in 3D culture. Scale bar, 200 μm . (C) Representative H-E staining images and IHC staining images showing Ki-67 in HSC-4 and OSC-19 spheroids. Scale bar, 200 μm in the upper two rows, 100 μm in the lower two rows.

Figure S3. Morphology and protein expression of oral cancer cells in 2D culture. Scale bars, 200 μm . The WB results show the time-dependence of the levels of E-cadherin and EGFR in SAS cells and HSC-3 cells.

Figure S4. (A) Representative H-E staining images of SAS spheroids on culture days 3 (left) and 7 (right). Black lines indicate regions with sparse cell density: the central regions and necrotic regions. Red lines indicate regions with high cell density: the limbus and dense small cells (short internuclear distance). Blue lines indicated luminal structures. Scale bar, 200 μm . (B) Representative H-E staining images in

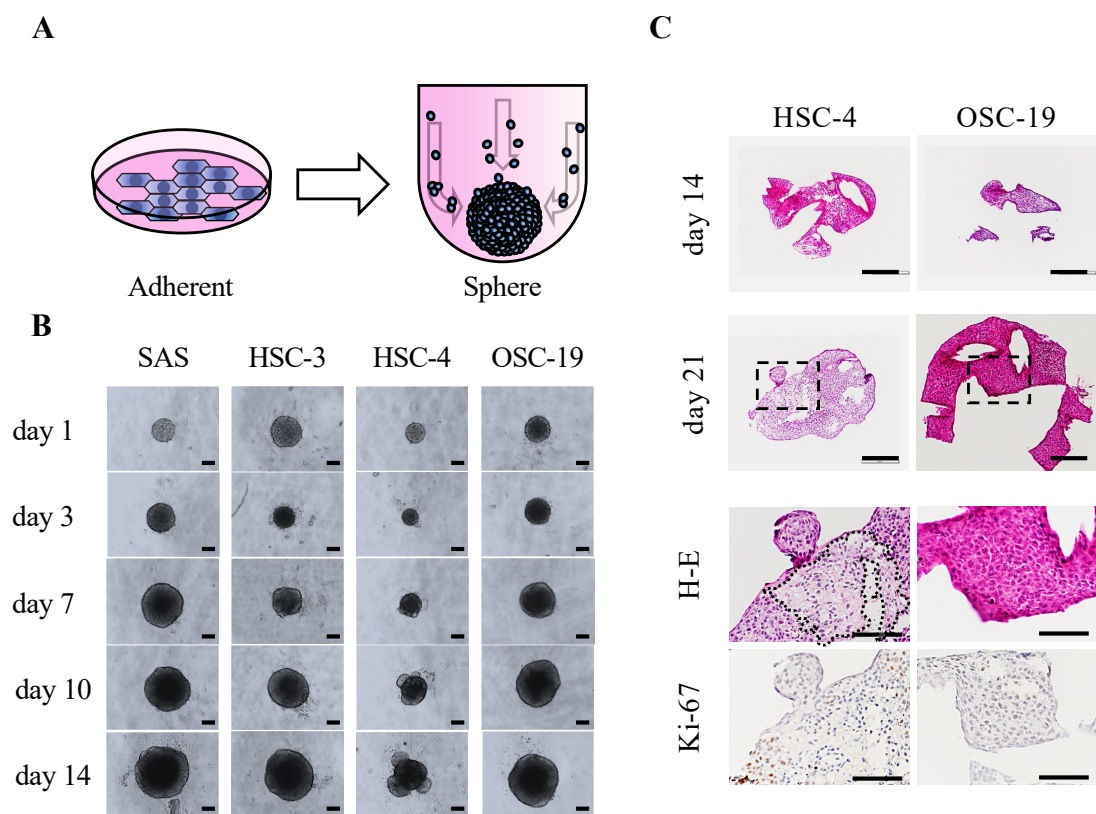

two oral cancer spheroids with different differentiation. Poorly differentiated SAS spheroids had a necrotic region (left). Well-differentiated HSC-4 spheroids had an aggregation of keratinocytes (right). Scale bar, 100 μm .

Figure S5. (A) Representative images of oral cancer cells with or without cisplatin in 2D and 3D culture. Scale bar, 200 μm . (B) Cell survival rate of oral cancer cells under 2D and 3D culture in cisplatin at the IC₅₀ concentration. $n = 3$. * $p < 0.05$, ** $p < 0.01$ (paired t-test).
