

Figure S1. The quality control program of scRNA data. (A-B). Number of gene features, total counts of gene expression, and percentage of mitochondrial genes before and after processing; (C). The correlations of mitochondrial genes, gene counts, and gene features; (D). The top ten of highly variable genes; (E-F). Before and after removal of batch effects by the Harmony package.

Figure S2. Marker genes for different subpopulation with UMAP.

Figure S3. The pre-processing of bulk RNA-seq data. (A). Violin plots of the three GEO datasets integrated after removing batches; (B-C). PCA plots of before and after removing batches effect.

Supplementary Table 1. 295 unique ER stress-related genes obtained from MSigDB v7.4
